

TimeTracker — Install Guide

How to install the time-tracking app and sign in. Takes about 2 minutes.

Before you start — 1 thing you'll need

- 1 The download page: <https://github.com/shlok-1006/TimeTracker/releases/latest> — always grab the newest version listed there (file names below say x.y.z where the current version number appears).

The app is internal, so your operating system shows a one-time “unknown developer” warning the first time you open it. That's expected — the steps below show exactly how to get past it.

Windows

- 1 On the download page, download **TimeTracker_x.y.z_x64-setup.exe**.
- 2 Run it. If Windows shows “Windows protected your PC”, click **More info** → **Run anyway**, then finish the installer.
- 3 Open TimeTracker from the Start menu.
- 4 Enter your company email and password, then click **Sign in**.

That's it — on Windows, screenshots and activity tracking work with no extra permissions.

macOS

- 1 On the download page, download **TimeTracker_x.y.z_universal.dmg** (works on both Intel and Apple-Silicon Macs).
- 2 Open the .dmg and drag **TimeTracker** into **Applications**.
- 3 Open TimeTracker from Applications. macOS blocks it with “Apple could not verify ‘TimeTracker’ is free of malware...”. Click **Done** — not “Move to Bin”.
- 4 Open **System Settings** → **Privacy & Security**. Scroll down to the Security section — you'll see “TimeTracker was blocked to protect your Mac.” with an **Open Anyway** button. Click it.
- 5 Authenticate (Touch ID / password), then click **Open Anyway** once more to confirm. The app opens — and from now on it launches normally with no warning.
- 6 Enter your company email and password, then click **Sign in**.

■ **REQUIRED on macOS — allow Screen Recording (step 7)**. Without this, macOS silently hides every other app from screenshots: your uploads will show **ONLY** your desktop wallpaper and the TimeTracker window, and your work will look invisible to your manager. macOS itself requires this to be done by hand:

System Settings → **Privacy & Security** → **Screen Recording** → **turn ON TimeTracker** → **then QUIT and REOPEN the app** (the permission only applies after a restart).

The app shows a **red banner** at the top while this permission is missing — if you see it, follow the banner (it has a “Grant permission” button). No red banner = you're all set.

If macOS instead says the app “is damaged and can't be opened”, open the Terminal app and run this once, then open TimeTracker again:

```
xattr -dr com.apple.quarantine /Applications/TimeTracker.app
```

Linux

1 Download **TimeTracker_x.y.z_amd64.AppImage** from the download page.

2 Make it runnable and launch it:

```
chmod +x TimeTracker_x.y.z_amd64.AppImage
./TimeTracker_x.y.z_amd64.AppImage
# if it complains about FUSE: sudo apt install libfuse2
```

3 Enter your company email and password, then click **Sign in**.

Trouble signing in?

- “Invalid credentials” — confirm your email/password with your admin. You can also change your password right on the login screen.
- Still stuck? Contact your administrator.
